

How A Frog Grows

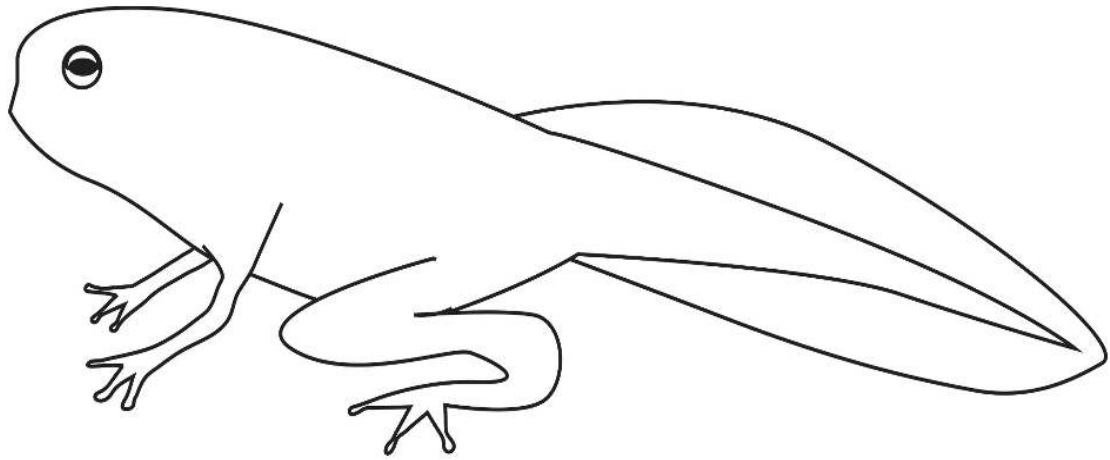

A frog starts out as a tiny spot inside an egg and grows bit by bit each day.

The baby frog
hatches as a
tadpole. A tadpole
eats algae in the
water.

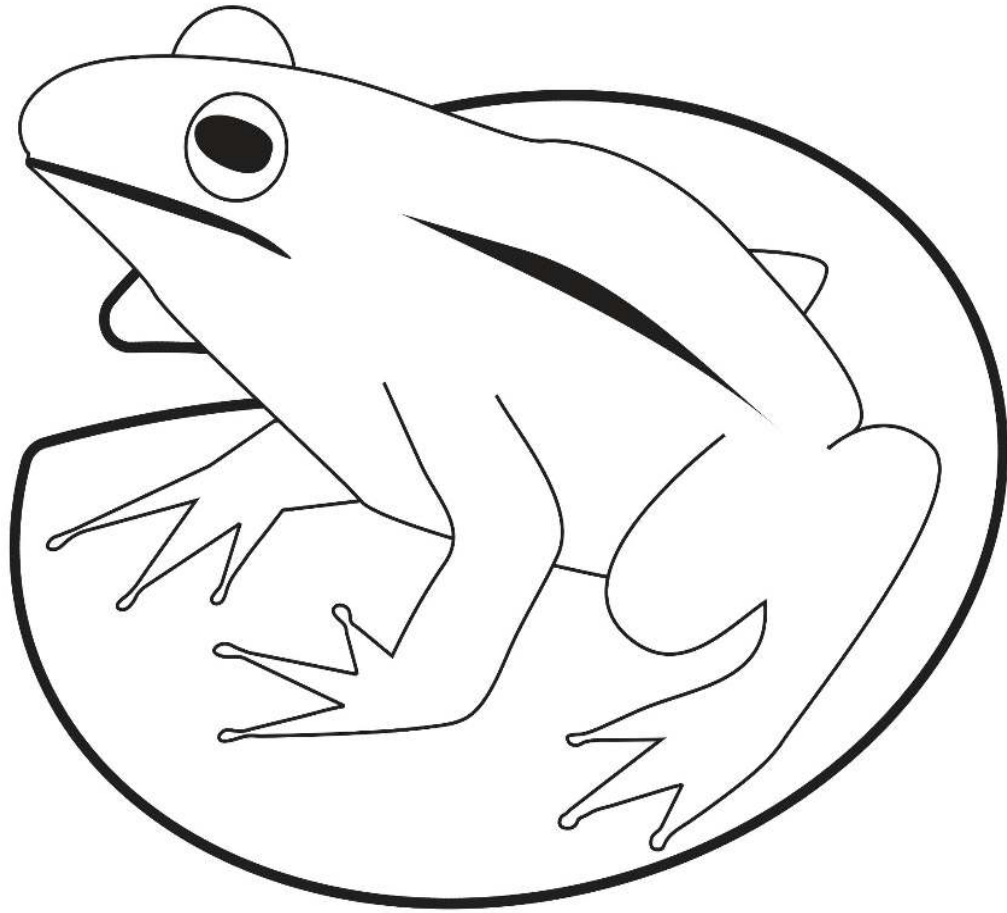

The tadpole starts
to grow legs and
loses it's gills.

The tadpole starts
to look more like a
frog and learns to
eat bugs.

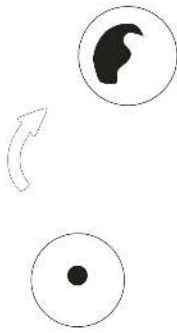

The tadpole is
quickly becoming a
frog and losing his
tail.

Frogs live near
ponds and eat
bugs.
